1 004 PCA & Clustering With Python

• Written by Alexandre Gazagnes

• Last update: 2024-02-01

1.1 About

Context:

You're an export project manager for a major food manufacturer. You are in charge of poultry departement. You have been asked to identify segments of countries within the company's database in order to target them with personalized marketing campaigns.

Data:

After a quick look on the internet, you find a very interesting dataset on the FAO website. It contains a list of countries with various indicators. You decide to use this dataset to identify segments of countries.

You can download the "raw" dataset here.

You can also use a preprocessed version of the dataset here.

Mission:

Your objective is to

- Take a quick tour of the data to understand the data set
- Clean up the dataset if necessary
- Perform clustering with Kmeans and Agglomerative Clustering, focusing on countries with large potential markets: populous countries, wealthy countries and/or countries with high import levels
- You need to be able to understand and explain the clusters you've created.

1.2 Preliminaries

1.2.1 System

These commands will display the system information:

Uncomment theses lines if needed.

```
[ ]:  # pwd
[]: # cd ...
[]:|
     # ls
[]: # cd ...
[]: # ls
    These commands will install the required packages:
[]: # !pip install pandas matplotlib seaborn plotly scikit-learn
    This command will download the dataset:
[]: # !wget https://gist.githubusercontent.com/AlexandreGazagnes/
      →7cc1176dfe0e281c45e0119210187ae2/raw/
      44e5c4caac35b88fcedea810f470957b7c5f9b5af/chicken\_cleaned.csv
    1.2.2 Import
    Import data libraries:
[]: import pandas as pd
     import numpy as np
    Import Graphical libraries:
[]: import matplotlib.pyplot as plt
     import seaborn as sns
     import plotly.express as px
    Import Machine Learning libraries:
[]: # must to have (mandarory)
     from sklearn.preprocessing import StandardScaler
```

1.2.3 Get the data

nice to have

1st option: Download the dataset from the web

from sklearn.datasets import load_iris

from sklearn.decomposition import PCA
from sklearn.cluster import KMeans

from sklearn.cluster import AgglomerativeClustering

from scipy.cluster.hierarchy import dendrogram, linkage

from sklearn.metrics import silhouette_score
from sklearn.metrics import davies_bouldin_score

2nd Option: Read data from a file

```
[]: # or

# fn = "./chicken_cleaned.csv"

# df = pd.read_csv(fn)

# df.head()
```

3rd Option : Load a toy dataset

```
[]: # or

# data = load_iris()
# df = pd.DataFrame(data.data, columns=data.feature_names)
# df["Species"] = data.target
# df.head()
```

1.3 Quick Data Viz

Write a function to display the correlation matrix:

Make a pairplot of the numerical columns:

This visualization can be slow with large datasets. Use VIZ = True / False to enable / disable the visualization.

```
[]: VIZ = False # Enable this with True
if VIZ:
    # write your code
```

1.4 Principal Component Analysis

1.4.1 Initialisation and fit

Initialize a PCA:

[]:	
	Fit:
[]:	
	Here is our new dataset :
[]:	
	Use pandas to create a DataFrame :
[]:	
	1.4.2 Analyse the components
[]:	
[]:	
	Recompute the first value :
[]:	
[]:	
[]:	(-0.37 * 0.66) + (-0.44 * 0.11) + (-1.1 * 0.34) + (-0.15 * 0.46) + (-0.46 * -0.46) + (0.11*-0.46)
[]:	
[]:	
[]:	
	1.4.3 Plot explained variance
	The explained variance ratio is pre-computed:
[]:	
	We can plot it:
[]:	
	A better feature is the cumulative variance :
[]:	
	We can plot it:
[]:	

1.4.4 Correlation graph

```
[]: def correlation_graph(
         X_scaled,
         pca,
         dim: list = [0, 1],
     ):
         """Affiche le graphe des correlations
         Positional arguments :
             X_scaled : DataFrame | np.array : le dataset scaled
             pca : PCA : l'objet PCA déjà fitté
         Optional arguments :
             dim : list ou tuple : le couple x,y des plans à afficher, exemple [0,1]_{\sqcup}
      ⇔pour F1, F2
         HHHH
         # Extrait x et y
         x, y = dim
         # features
         features = X_scaled.columns
         # Taille de l'image (en inches)
         fig, ax = plt.subplots(figsize=(10, 9))
         # Pour chaque composante :
         for i in range(0, pca.components_.shape[1]):
             # Les flèches
             ax.arrow(
                 0,
                 0,
                 pca.components_[x, i],
                 pca.components_[y, i],
                 head_width=0.07,
                 head_length=0.07,
                 width=0.02,
             )
             # Les labels
             plt.text(
                 pca.components_[x, i] + 0.05,
                 pca.components_[y, i] + 0.05,
                 features[i],
             )
```

```
# Affichage des lignes horizontales et verticales
plt.plot([-1, 1], [0, 0], color="grey", ls="--")
plt.plot([0, 0], [-1, 1], color="grey", ls="--")
# Nom des axes, avec le pourcentage d'inertie expliqué
plt.xlabel(
    "F{} ({}%)".format(
       x + 1, round(100 * pca.explained_variance_ratio_[x], 1)
)
plt.ylabel(
    "F{} ({}%)".format(
       y + 1, round(100 * pca.explained_variance_ratio_[y], 1)
)
# title
plt.title("Cercle des corrélations (F{} et F{})".format(x + 1, y + 1))
# Le cercle
an = np.linspace(0, 2 * np.pi, 100)
plt.plot(np.cos(an), np.sin(an)) # Add a unit circle for scale
# Axes et display
plt.axis("equal")
plt.show(block=False)
```

```
[]: correlation_graph(# Add arguments)
```

```
[]: correlation_graph(# Add arguments)
```

```
[]: correlation_graph(# Add arguments)
```

1.4.5 Factorial planes

```
[]: def factorial_planes(
    X_,
    pca,
    dim,
    labels: list = None,
    clusters: list = None,
    figsize: list = [12, 10],
    fontsize = 14,
):

"""Affiche les plans factoriels
"""
```

```
x, y = dim
  dtypes = (pd.DataFrame, np.ndarray, pd.Series, list, tuple, set)
  if not isinstance(labels, dtypes):
       labels = []
  if not isinstance(clusters, dtypes):
       clusters = []
  # Initialisation de la figure
  fig, ax = plt.subplots(1, 1, figsize=figsize)
  if len(clusters):
       sns.scatterplot(data=None, x=X_[:, x], y=X_[:, y], hue=clusters)
  else:
       sns.scatterplot(data=None, x=X_[:, x], y=X_[:, y])
  \# Si la variable pca a été fournie, on peut calculer le \% de variance de \sqcup
⇔chaque axe
  v1 = str(round(100 * pca.explained_variance_ratio_[x])) + " %"
  v2 = str(round(100 * pca.explained_variance_ratio_[y])) + " %"
  # Nom des axes, avec le pourcentage d'inertie expliqué
  ax.set_xlabel(f"F{x+1} {v1}")
  ax.set_ylabel(f"F{y+1} {v2}")
  # Valeur x max et y max
  x_{max} = np.abs(X_{[:, x]}).max() * 1.1
  y_{max} = np.abs(X_{[:, y]}).max() * 1.1
  # On borne x et y
  ax.set_xlim(left=-x_max, right=x_max)
  ax.set_ylim(bottom=-y_max, top=y_max)
  # Affichage des lignes horizontales et verticales
  plt.plot([-x_max, x_max], [0, 0], color="grey", alpha=0.8)
  plt.plot([0, 0], [-y_max, y_max], color="grey", alpha=0.8)
  # Affichage des labels des points
  if len(labels):
       for i, (_x, _y) in enumerate(X_[:, [x, y]]):
           plt.text(
               _x, _y + 0.05, labels[i], fontsize=fontsize, ha="center", _
⇔va="center"
           )
  # Titre et display
```

```
plt.title(f"Projection des individus (sur F{x+1} et F{y+1})")
         plt.show()
[]: factorial_planes(# add arguments)
[]: factorial_planes(# add arguments)
    1.5 Kmeans
    1.5.1 First Naive Clustering
    Initialize the Kmeans model with arbitrary number of clusters:
[]:
    Fit the Kmeans model to the data:
[]:
    Use alphanumerical labels for the clusters:
[]: labels_values = {0:"A", 1:"B", 2:"C", 3:"D", 4:"E", 5:"F", 6:"G", 7:"H", 8:"I", ...
       գ9:"J"}
    Create a copy of the original dataset and add labels:
[]:
    What about A cluster?
[]:
    What about B cluster?
[]:
    Etc etc...
[]:
[]:
[]:
[]:
    Build a boxplot for each cluster:
[]:
    Same but with plotly:
[]:
```

1.5.2 Find the best number of clusters

Compute the inertia for different number of clus	ters:
--	-------

[]:	# WCSS : Within-Cluster-Sum-of-Squares
	Plot the inertia for different number of clusters:
[]:	
	Same but with davies bouldin score:
[]:	# DB Score
[]:	
	Same but with silhouette score:
[]:	# silhouette Score
[]:	
	1.5.3 Use the best number of clusters
	Fit the Kmeans model to the data with the best number of clusters:
[]:	
	Have a look to labels
[]:	
	Use string values for labels:
[]:	
	Update _df dataset with labels:
[]:	
[]:	
	Have a look to A cluster:
[]:	
	Have a look to B cluster:
[]:	
	Etc etc
[]:	

[]:	
[]:	
[]:	
[]:	
[]:	
	Use boxplot to visualize the clusters:
[]:	
	The D cluster is interesting:
[]:	
[]:	
	1.6 OPTIONAL Agglomerative Clustering (Hierarchical Clustering)
	Create a model with the best number of clusters:
[]:	
	Fit the model to the data:
[]:	
	Have a look to labels :
[]:	
	Use string values for labels:
[]:	
	Update _df dataset with new labels:
[]:	
	Have a look to A cluster:
[]:	
	Have a look to B cluster:
[]:	
	Etc etc
[]:	

```
[]:
[]:
[]:
    Use Plotly to visualize the clusters:
[]:
    Plot the dendrogram
[]: plt.figure(figsize=(10, 5))
     plt.xlabel("sample index")
     plt.ylabel("distance")
     z = linkage(X_scaled, method="ward")
     dendrogram(
         z,
         leaf_rotation=90,
         p=5,
         color_threshold=10,
         leaf_font_size=10,
         truncate_mode="level",
     plt.tight_layout()
[]:
```
