1 003 Data Preparation & Analysis With Python

• Written by Alexandre Gazagnes

• Last update: 2024-02-01

1.1 About

Context:

You're an export project manager for a major food manufacturer. You are in charge of poultry departement. You have been asked to identify segments of countries within the company's database in order to target them with personalized marketing campaigns.

Data:

After a quick look on the internet, you find a very interesting dataset on the FAO website. It contains a list of countries with various indicators. You decide to use this dataset to identify segments of countries.

You can download the "raw" dataset here.

You can also use a preprocessed version of the dataset here.

Mission:

Your objective is to

- Take a quick tour of the data to understand the data set
- Clean up the dataset if necessary
- Perform clustering with Kmeans and Agglomerative Clustering, focusing on countries with large potential markets: populous countries, wealthy countries and/or countries with high import levels
- You need to be able to understand and explain the clusters you've created.

1.2 Preliminaries

1.2.1 System

These commands will display the system information:

Uncomment theses lines if needed.

```
[ ]:  # pwd
[]: # cd ...
[]:
     # ls
[]: # cd ...
[]: # ls
    These commands will install the required packages:
[]: # !pip install pandas matplotlib seaborn plotly scikit-learn
    This command will download the dataset:
[]: | wget https://gist.githubusercontent.com/AlexandreGazagnes/
      →28a8da40ffa339b96b02f3e3cd79792d/raw/
      →4849eba0d69f43472a7637e1b62e56fd7eb09c7e/chicken.csv
    1.2.2 Import
    Import data libraries:
[]: import pandas as pd
     import numpy as np
    Import Graphical libraries:
[]: import matplotlib.pyplot as plt
     import seaborn as sns
     import plotly.express as px
    Import Machine Learning libraries:
[]: from sklearn.preprocessing import StandardScaler
     from sklearn.decomposition import PCA
    1.2.3 Get the data
    1st option: Download the dataset from the web
[]: url = "https://gist.githubusercontent.com/AlexandreGazagnes/
      →28a8da40ffa339b96b02f3e3cd79792d/raw/
```

2nd Option: Read data from a file

df = pd.read_csv(url)

df.head()

→4849eba0d69f43472a7637e1b62e56fd7eb09c7e/chicken.csv"

```
[]:  # or

# fn = "./chicken.csv"

# df = pd.read_csv(fn)

# df.head()
```

3rd Option: Load a toy dataset

```
[]: # or

# data = load_iris()
# df = pd.DataFrame(data.data, columns=data.feature_names)
# df["Species"] = data.target
# df.head()
```

1.3 Data Exploration

1.3.1 Display

Display the first rows of the dataset:

```
[ ]:  # Head
```

Display the last rows of the dataset:

```
[]: # Tail
```

Display a sample of the dataset:

```
[]: # Sample 20
```

1.3.2 Structure

What is the shape of the dataset?

```
[]: # Structure
```

What data types are present in the dataset?

Get all the columns names:

```
[]: # Info
```

Count the number of columns with specific data types:

```
[]: # Value counts on dtypes
```

Select only string columns:

```
[]: # Select dtypes str
```

Select only numerical columns:

```
[]: | # Select dtypes float
```

Count number of unique values :

```
[]: # Number unique values for int columns
```

```
[]: # Number unique values for float columns
```

```
[]: # Number unique values for object columns
```

1.3.3 NaN

How many NaN are present in the dataset?

```
[]:  # isna ?
```

```
[]: # Sum of isna
```

1.3.4 Data Inspection

Have a look to a numercial summary of the dataset:

```
[]:  # Describe ?
```

```
[]:  # Better ?
```

Compute the correlation matrix:

```
[]: # creating tmp variable
```

Try a first visualization of the correlation matrix:

```
[]: # Building heatmap
```

```
[]: # Better heatmap ?
```

Find the best visualization for the correlation matrix:

```
[]: # Best heatmap ?
```

Write a function to display the correlation matrix:

```
[]: # With a function

def make_corr_heatmap(df):
    corr = df.select_dtypes(include="number").corr()
    mask = np.triu(corr)
```

```
sns.heatmap(corr, annot=True, cmap="coolwarm", fmt=".2f", vmin=-1, vmax=1, umax=1, uma
                          ⊶mask=mask)
[]:
                 1.3.5 Visualization
                 Use Boxplot to visualize the distribution of the numerical columns:
[]: # Box plot 1
                 Try to apply log transformation to the numerical columns:
[]:
                 Plot all numerical columns:
[]:
                 Plot each numerical column:
[]:
                 Make a pairplot of the numerical columns:
                 This visualization can be slow with large datasets. Use VIZ = True / False to enable / disable the
                 visualization.
[]: VIZ = False # Enable this with True
                    if VIZ:
                                     # write your code
                 1.4 Data Cleaning
                 1.4.1 Population
                 Have a look to small countries
[]:
                 Update the population with the good number
[]:
                 Sort the dataset by population
[]:
[]:
                 Remember the shape of the dataset
[]:
```

Select only "large" countries +1M: []: []: Select only "large" countries +5M: []: []: []: 1.4.2 Columns Select only relevant columns: []: cols = ["code_zone", "zone", "dispo_int", # WHY NOT "import", # "dispo_prot", "dispo_alim", "export", # "residus", # "var_stock", # "prod", # "nourriture", "population", []: make_corr_heatmap(df) 1.5 Feature engineering Have a look to our dataset: []: 1.5.1 Depedency Create a new column with some kind of "depedency": []: []:

[]:	
	Drop columns with infini values:
[]:	
	Drop useless columns if needed:
[]:	
	1.5.2 Delta
	Compute diffrence between columns Import and Export:
[]:	
[]:	
	Export is no more needed:
[]:	
	1.5.3 Export our cleaned dataset
[]:	
	1.5.4 Scale
[]:	
	Select only numerical columns:
[]:	
	Use SciKit Learn to scale the dataset:
[]:	
	Rebuild a DataFrame with the scaled data:
[]:	
	Check that data were scaled:
[]:	
	Of course you can compute the scaling manually:
[]:	
[]:	

1.6 Principal Component Analysis

1.6.1 Initialisation and fit

	Initialize a PCA:
[]:	
	Fit:
[]:	
	Here is our new dataset :
[]:	
	Use pandas to create a DataFrame :
[]:	
	1.6.2 Analyse the components
[]:	
[]:	
	Recompute the first value :
[]:	
[]:	
[]:	(-0.37 * 0.66) + (-0.44 * 0.11) + (-1.1 * 0.34) + (-0.15 * 0.46) + (-0.46 * -0. →1) + (0.11*-0.46)
[]:	
[]:	
[]:	
	1.6.3 Plot explained variance
	The explained variance ratio is pre-computed:
[]:	
	We can plot it:
[]:	
	A better feature is the cumulative variance :

8

We can plot it:

[]:

1.6.4 Correlation graph

```
[]: def correlation_graph(
         X_scaled,
         pca,
         \dim: list = [0, 1],
     ):
         """Affiche le graphe des correlations
         Positional arguments :
             X_scaled : DataFrame | np.array : le dataset scaled
             pca : PCA : l'objet PCA déjà fitté
         Optional arguments :
             dim : list ou tuple : le couple x,y des plans à afficher, exemple [0,1]_{\sqcup}
      ⇔pour F1, F2
         nnn
         # Extrait x et y
         x, y = dim
         # features
         features = X_scaled.columns
         # Taille de l'image (en inches)
         fig, ax = plt.subplots(figsize=(10, 9))
         # Pour chaque composante :
         for i in range(0, pca.components_.shape[1]):
             # Les flèches
             ax.arrow(
                 0,
                 0,
                 pca.components_[x, i],
                 pca.components_[y, i],
                 head_width=0.07,
                 head_length=0.07,
                 width=0.02,
             # Les labels
```

```
plt.text(
        pca.components_[x, i] + 0.05,
        pca.components_[y, i] + 0.05,
        features[i],
    )
# Affichage des lignes horizontales et verticales
plt.plot([-1, 1], [0, 0], color="grey", ls="--")
plt.plot([0, 0], [-1, 1], color="grey", ls="--")
# Nom des axes, avec le pourcentage d'inertie expliqué
plt.xlabel(
    "F{} ({}%)".format(
       x + 1, round(100 * pca.explained_variance_ratio_[x], 1)
    )
)
plt.ylabel(
    "F{} ({}%)".format(
       y + 1, round(100 * pca.explained_variance_ratio_[y], 1)
)
# title
plt.title("Cercle des corrélations (F{} et F{})".format(x + 1, y + 1))
# Le cercle
an = np.linspace(0, 2 * np.pi, 100)
plt.plot(np.cos(an), np.sin(an)) # Add a unit circle for scale
# Axes et display
plt.axis("equal")
plt.show(block=False)
```

```
[]: correlation_graph(# Add arguments)
```

```
[]: correlation_graph(# Add arguments)
```

```
[]: correlation_graph(# Add arguments)
```

1.6.5 Factorial planes

```
[]: def factorial_planes(
    X_,
    pca,
    dim,
    labels: list = None,
    clusters: list = None,
```

```
figsize: list = [12, 10],
    fontsize = 14,
):
    """Affiche les plans factoriels
    11 11 11
    x, y = dim
    dtypes = (pd.DataFrame, np.ndarray, pd.Series, list, tuple, set)
    if not isinstance(labels, dtypes):
        labels = []
    if not isinstance(clusters, dtypes):
        clusters = []
    # Initialisation de la figure
    fig, ax = plt.subplots(1, 1, figsize=figsize)
    if len(clusters):
        sns.scatterplot(data=None, x=X_[:, x], y=X_[:, y], hue=clusters)
    else:
        sns.scatterplot(data=None, x=X_[:, x], y=X_[:, y])
    # Si la variable pca a été fournie, on peut calculer le % de variance de la
 ⇔chaque axe
    v1 = str(round(100 * pca.explained_variance_ratio_[x])) + " %"
    v2 = str(round(100 * pca.explained_variance_ratio_[y])) + " %"
    # Nom des axes, avec le pourcentage d'inertie expliqué
    ax.set_xlabel(f"F{x+1} {v1}")
    ax.set_ylabel(f"F{y+1} {v2}")
    # Valeur x max et y max
    x_{max} = np.abs(X_{[:, x]}).max() * 1.1
    y_{max} = np.abs(X_{[:, y]}).max() * 1.1
    # On borne x et y
    ax.set_xlim(left=-x_max, right=x_max)
    ax.set_ylim(bottom=-y_max, top=y_max)
    # Affichage des lignes horizontales et verticales
    plt.plot([-x_max, x_max], [0, 0], color="grey", alpha=0.8)
    plt.plot([0, 0], [-y_max, y_max], color="grey", alpha=0.8)
    # Affichage des labels des points
    if len(labels):
        for i, (_x, _y) in enumerate(X_[:, [x, y]]):
```

```
[]: factorial_planes(# add arguments)
```

```
[]: factorial_planes(# add arguments)
```
